Basics (1)

程序代写代做 CS编程辅导

3

- The bit is the most basic information in a computer
 - ▣ Switching activity (1 bit)
- A Byte is a group of 8 bits
 - ▣ A byte is the smallest possible addressable unit of computer storage
 - ▣ The term, “addressable,” means that a particular byte can be retrieved according to its location in memory
- A word is a contiguous group of bytes, e.g., an integer uses 4 bytes
- Word sizes of 4 or 8 bytes are most common

QQ: 749389476

<https://tutorcs.com>

Basics (2)

程序代写代做 CS编程辅导

Kilo- (K) = 1 thousand = 10^3 and 2^{10}

Mega- (M) = 1 million = 10^6 and 2^{20}

Giga- (G) = 1 billion = 10^9 and 2^{30}

Tera- (T) = 1 trillion = 10^{12} and 2^{40}

Peta- (P) = 1 quadrillion = 10^{15} and 2^{50}

Exa- (E) = 1 quintillion = 10^{18} and 2^{60}

Zetta- (Z) = 1 sextillion = 10^{21} and 2^{70}

Yotta- (Y) = 1 septillion = 10^{24} and 2^{80}

Normally, powers of 2 are used for measuring capacity

Email: tutorcs@163.com

QQ: 749389476

<https://tutorcs.com>

Milli- (m) = 1 thousandth = 10^{-3}

Micro- (μ) = 1 millionth = 10^{-6}

Nano- (n) = 1 billionth = 10^{-9}

Pico- (p) = 1 trillionth = 10^{-12}

Basics (3)

程序代写代做 CS编程辅导

5

- Hertz = clock cycles per second (frequency)
 - ▣ 1MHz = 1,000,000 Hz
 - ▣ Processor speeds are measured in MHz or GHz
- Byte = a unit of storage
 - ▣ 1KB = 2^{10} = 1024 Bytes
 - ▣ 1MB = 2^{20} = 1,048,576 Bytes
 - ▣ 1GB = 2^{30} = 1,073,741,824 Bytes
- Main memory (RAM) is measured in GB
- Disk storage is measured in GB for small systems, TB (2^{40}) for large systems

POSITIONAL NUMBERING SYSTEMS (1)

程序代写代做 CS编程辅导

6

- Positional numbering systems are systems in which the placement of a digit in connection to its value determines its actual meaning in a numeral string

WeChat: cstutorcs

- The organization of any computer depends considerably on how it represents numbers, characters, and control information
 - There are several positional numbering systems such as Decimal, Binary, Octal, Hexadecimal etc

Assignment Project Exam Help

Email: tutorcs@163.com

QQ: 749389476

- The positioning system is provided as a subscript, e.g., 14_{10} , 10101_2 , 82_{16}

<http://tutorcs.com>

POSITIONAL NUMBERING SYSTEMS (2)

程序代写代做 CS编程辅导

7

- Our decimal system is the base-10 system. It uses powers of 10 for each position in a number.

- The binary system is also called the base-2 system

Assignment Project Exam Help

- The hexadecimal system is the base-16 system

Email: tutorcs@163.com

- The Mayan and other Mesoamerican cultures used a number system based in a base-20 system

QQ: 749389476
<https://tutorcs.com>

Decimal System

程序代写代做 CS编程辅导

8

□ **Decimal system:** Our we and used system.

□ It uses 10 different d, 3, 4, 5, 6, 7, 8, 9

□ Our decimal system is 10 system. It uses powers of 10 for each position in a number

□ For example, the decimal number 947 in powers of 10 is

947 =

= $9 \times 100 + 4 \times 10 + 7 \times 1 =$

= $9 \times 10^2 + 4 \times 10^1 + 7 \times 10^0$

QQ: 749389476

□ $70216 = 7 \times 10000 + 0 \times 1000 + 2 \times 100 + 1 \times 10 + 6 \times 1 =$

$= 7 \times 10^4 + 0 \times 10^3 + 2 \times 10^2 + 1 \times 10^1 + 6 \times 10^0$

□ The decimal number 3812.46 in powers of 10 is $(3 \times 10^3 + 8 \times 10^2 + 1 \times 10^1 + 2 \times 10^0 + 4 \times 10^{-1} + 6 \times 10^{-2})$

Binary System

程序代写代做 CS编程辅导

9

- A binary number is expressed in the base-2 numeral system or binary numeral system, which uses only two symbols: typically 0 (zero) and 1 (one)
- The base is 2
- **2 different digits are used: 0, 1**
- For example, $101_2 = 1 \times 2^2 + 0 \times 2^1 + 1 \times 2^0$
 $= 1 \times 4 + 0 \times 2 + 1 \times 1$
 $= 5_{10}$
- The binary number 11001 in powers of 2 is: $1 \times 2^4 + 1 \times 2^3 + 0 \times 2^2 + 0 \times 2^1 + 1 \times 2^0 = 16 + 8 + 0 + 0 + 1 = 25_{10}$
- $1011.101_2 =$
 $= 1 \times 2^3 + 0 \times 2^2 + 1 \times 2^1 + 1 \times 2^0 + 1 \times 2^{-1} + 0 \times 2^{-2} + 1 \times 2^{-3} =$
 $= 1 \times 8 + 0 \times 4 + 1 \times 2 + 1 \times 1 + 1 \times 0.5 + 0 \times 0.25 + 1 \times 0.125$
 $= 11.625_{10}$

WeChat: cstutorcs

Assignment Project Exam Help

Email: tutorcs@163.com

QQ: 749389476

<https://tutorcs.com>

Octal system

程序代写代做 CS编程辅导

10

- The base is 8
- **8 different digits** Only: 0,1,2,3,4,5,6,7
- For example: $436_8 = 4 \times 8^2 + 3 \times 8^1 + 6 \times 8^0$

$$= 4 \times 64 + 3 \times 8 + 6 \times 1$$

WeChat: cstutorcs

$$= 286_{10}$$

Assignment Project Exam Help

Convert the following octal number 205.24_8 to decimal:

Email: tutorcs@163.com

$$205.24_8 = 2 \times 8^2 + 0 \times 8^1 + 5 \times 8^0 + 2 \times 8^{-1} + 4 \times 8^{-2}$$
$$= 2 \times 64 + 0 + 5 + 2 \times 0.125 + 4 \times 0.015625$$
$$= 133.3125_{10}$$

QQ: 749389476 <https://tutorcs.com>

Hexadecimal system

程序代写代做 CS编程辅导

11

- The base is 16
- **16 different digits** 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, A, B, C, D, E, F
(we do not use numbers with 2 digits like 10,11,12,...), but
A instead of 10, B instead of 11, C instead of 12, etc)

- Example: $3B1_{16} = 3 \times 16^2 + 11 \times 16^1 + 1 \times 16^0$
 $= 3 \times 256 + 11 \times 16 + 1 =$
 $= 768 + 176 + 1 =$
 $= 945_{10}$

Convert the following hexadecimal number $20C.2_{16}$ to decimal

$$\begin{aligned} 20C.2_{16} &= 2 \times 16^2 + 0 \times 16^1 + 12 \times 16^0 + 2 \times 16^{-1} = \\ &= 2 \times 256 + 0 + 12 \times 1 + 2 \times 0.0625 = \\ &= 512 + 12 + 0.125 = \\ &= \mathbf{524.125_{10}} \end{aligned}$$

In the Lab session

程序代写代做 CS编程辅导

12

- You will learn how to convert from a system to another...

<https://tutorcs.com>

Positional Numbering Systems - General case

程序代写代做 CS编程辅导

13

- Base: r
- Uses r different digits $0, 1, \dots, r-1$

$$N_r = A_{n-1} A_{n-2} \dots A_1 A_0 A_{-1} A_{-2} \dots A_{-(m-1)} A_{-m}$$
$$N_r = A_{n-1} \times r^{n-1} + A_{n-2} \times r^{n-2} + \dots + A_1 \times r^1 + A_0 \times r^0 + A_{-1} \times r^{-1} + A_{-2} \times r^{-2} + \dots + A_{-(m-1)} \times r^{-(m-1)} + A_{-m} \times r^{-m}$$

WeChat: cstutorcs
Assignment Project Exam Help
Email: tutorms@163.com
QQ: 749389476
https://tutorms.com

To better understand the above formula consider that if $234.03_5 = ?_{10}$ then $n=3, m=2$ and $r=5$

- The left most digit (A_{n-1}) is called Most Significant Bit-(MSB) while the right most (A_{-m}) Least Significant Bit-(LSB)

Basic arithmetic operations

程序代写代做 CS编程辅导

14

- The basic arithmetic operations are applied to **all** the previous numerical systems. The

- Addition
- Subtraction
- Multiplication
- Division

Signed integer representation

程序代写代做 CS编程辅导

15

Introduction

- In practice we have to give binary numbers too. **We need to define signed binary**

- ✓ **There are three ways in which signed binary integers may be expressed:**

WeChat: cstutorcs

Assignment Project Exam Help

Email: tutorcs@163.com

QQ: 749389476

<https://tutorcs.com>

1. **Signed magnitude**

2. **One's complement**

3. **Two's complement**

Signed Magnitude Representation (1)

程序代写代做 CS编程辅导

16

- **Allocate the high-order bit to indicate the sign of a number**
 - ▣ The high-order bit is the sign bit. It is also called the most significant bit
 - ▣ 0 is used to indicate a positive number; 1 indicates a negative number
- The remaining bits contain the value of the number
- Note that we also **pay attention to the number of bits used** to represent signed binary numbers
 - ▣ i.e. if using 4 bit numbers, then we use 0001_2 rather than 1_2
- In an 8-bit word, signed magnitude representation places the absolute value of the number in the 7 bits to the right of the sign bit

WeChat: cstutorcs

Assignment Project Exam Help

Email: tutorcs@163.com

QQ: 749389476

<https://tutorcs.com>

For example:

+3 is: 00000011

- 3 is: 10000011

Signed Magnitude Representation (2)

程序代写代做 CS编程辅导

17

- The "binary addition" does NOT work with sign-magnitude

$$0 \ 0 \ 1 \ 1_2 = 3_{10}$$

$$1 \ 1 \ 0 \ 0_2 = -4_{10}$$

WeChat: cstutorcs

Assignment Project Exam Help

Email: tutorcs@163.com

QQ: 749389476

<https://tutorcs.com>

$$\begin{array}{r} 0 \quad 0 \ 1 \ 1 \\ 1 + 1 \ 0 \ 0 \\ \hline 1 \quad 1 \ 1 \ 1 \end{array}$$

this is wrong

Signed Magnitude: intuitive for humans, difficult for computers

程序代写代做 CS编程辅导

18

- ❑ Signed magnitude notation is easy for people to understand, but it is complicated computer hardware

- ❑ Also it allows two different representations for zero: positive zero and negative zero

WeChat: cstutorcs

Assignment Project Exam Help

- ❑ As such, computer systems employ **complement systems** for signed number representation

Email: tutorcs@163.com

QQ: 749389476

<https://tutorcs.com>

Signed Integer Representation

Complement Systems

程序代写代做 CS编程辅导

19

- In binary systems, these are used to represent **negative values**, invert all the bits in the binary representation of the number (flipping 0s for 1s and vice versa)

- 1 becomes 0 and 0 becomes 1

- To represent **positive** numbers no change is applied

For example, using 8-bit one's complement representation

+ 3 is: 00000011

- 3 is: 11111100

WeChat: cstutorcs

Assignment Project Exam Help

More examples

Email: tutorcs@163.com

$X=11011100$, $1C(X)=00100011$

$X=1011$, $1C(X)=?$ QQ: 749389476

- One's complement still has the disadvantage of having two different representations for zero (positive zero and negative zero)
- In addition positive and negative integers need to be processed separately
- Two's complement solves this problem

<http://tutorcs.com>

Two's complement

- One's Complement add 1

Signed Integer Representation

程序代写代做CS编程辅导

20

Two's complement $2C(X)$

- ❑ You represent **positive** just like the unsigned numbers
- ❑ To represent **negative** values, start with the corresponding positive number, invert all the bits. Then add 1.

WeChat: estutorcs

- ❑ For example, using 8-bit two's complement representation:

+ 3 is: 00000011

Assignment Project Exam Help
1. Start with positive number

11111100

Email: tutorcs@163.com

+

3. Add 1

QQ: 749389476

- 3 is: 11111101

-3 in 8-bit Two's Complement Representation is 11111101

https://tutorcs.com

- ✓ **Negative numbers must always start with '1'**
- ✓ **Both positive and negative numbers must have the same number of bits**

Floating-Point Representation (1)

程序代写代做 CS编程辅导

21

- To represent real numbers and fractional values, floating-point representation is used.
- Floating-point numbers are often expressed in scientific notation
 - For example: $0.125 = 1.25 \times 10^{-1}$
- Remember that when a number is multiplied by its base, e.g., 10, then we add a zero or we move the ‘.’ by one position to the right
 - $235 \times 10 = 2350$
 - $1.345 \times 10 = 13.45$
 - $110_2 \times 2 = 1100_2$ ($6 \times 2 = 12_{10}$)
 - $101.11_2 \times 2 = 1011.1$ ($5.75 \times 2 = 11.5_{10}$)

WeChat: cstutorcs

Assignment Project Exam Help

Email: tutorcs@163.com

QQ: 749389476

<https://tutorcs.com>

Floating-Point Representation (2)

程序代写代做 CS编程辅导

22

- Computers use a form of scientific notation for floating-point representation
 - Single Precision floating point format 32-bit
 - Double Precision floating point format 64-bit
- Numbers written in scientific notation have three components:

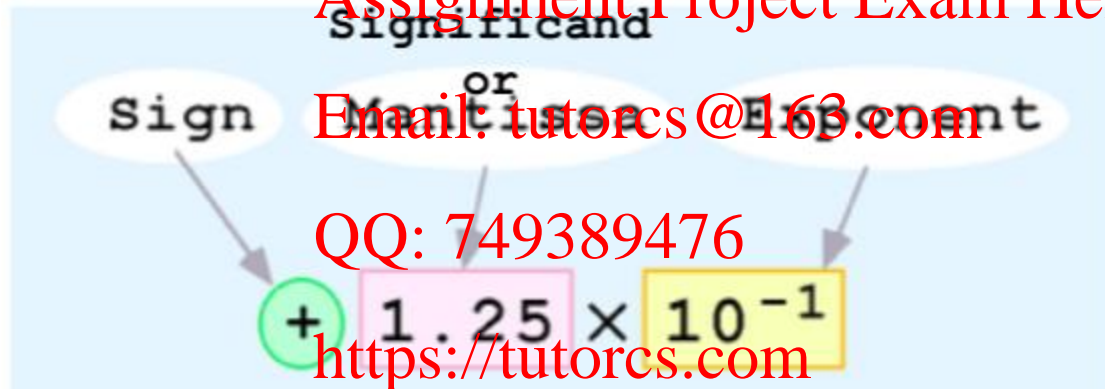

WeChat: tutorcs

Assignment Project Exam Help

Email: tutorcs@163.com

QQ: 749389476

<https://tutorcs.com>

Single precision Floating-Point format (1)

程序代写代做 CS编程辅导

23

A binary number is represented in IEEE 754 format as follows:

1. We write the number in normalized form: a single non-zero digit before the radix point :

e.g., $1011010010001 = 1.0001 \times 2^{12}$

$1101.10111 = 1.10110111 \times 2^3$

2. Then we transform the number to the following format using 32 bits

$$N = (-1)^S (1 + F) (2^{E-127})$$

Assignment Project Exam Help

Sign-S	Exponent-E	Mantissa (Fraction) - F
1-bit	8 - bits	23 - bits

Email: tutorcs@163.com

S: Sign, 0/1 for positives/negatives, respectively

E: Exponent. $E-127 = \text{exp}$, where exp is the corresponding exponent

F: Significant or Mantissa. We write the fractional part in 23 bits

<http://tutorcs.com>

$E = 127 + \text{exp}$ in order to avoid using negative numbers. $\text{exp} = [-127, 128]$ and therefore $E = [0, 255]$ – 255 needs 8 bits

Single precision Floating-Point format (2)

程序代写代做 CS编程辅导

24

Convert the positive real number $N = 1011010010001$ in Floating point format

Step 1: $1011010010001 = 1.011010010001 \times 2^{12}$

Step 2: $N = (-1)^S (1+F)(2^{E-127})$

$S = 0$ (positive number)

$E - 127 = 12$, and thus $E = 139$ and $E = 10001011_2$

$F = 011010010001000000000000$

Therefore N in FP format is:

0	10001011	011010010001000000000000
---	----------	--------------------------

Single precision Floating-Point format (3)

程序代写代做 CS编程辅导

25

Suppose that the 32-bit floating-point representation pattern is the following. Find the number

1	10010001	100011100010000000000000
---	----------	--------------------------

WeChat: cstutorcs

S is 1 and thus the number is negative

E is 10010001 = 145₁₀, and thus the exponent is $\text{exp} = E - 127 = 145 - 127 = 18$

F = 100011100010000000000000

$N = (-1)^S (1 + F)(2^{E-127})$

N is $(-1)^1 \times 1.100011100010000000000000 \times 2^{18}$ or

$N = -11000111000100000000$

QQ: 749389476

<https://tutorcs.com>

Floating-Point Representation (1)

程序代写代做 CS编程辅导

26

- No matter how many bits a FP representation, the model is finite
 - ▣ The real number system is, of course, infinite, so our models can give nothing more than an approximation of a real value
 - ▣ e.g., how to represent 33.333333333333333333333333?
- At some point, every model breaks down, introducing errors into our calculations
 - ▣ By using a greater number of bits in our model, we can reduce these errors, but we can never totally eliminate them

WeChat: cstutorcs

Assignment Project Exam Help

Email: tutorcs@163.com

QQ: 749389476

<https://tutorcs.com>

Why is $0.1 + 0.2$ not equal to 0.3 in most programming languages?

27

- computers use a binary floating point format that cannot accurately represent a number
- 0.1_{10} is already rounded to the nearest number in that format
- 0.1_{10} doesn't exist in the FP representation
- 0.1_{10} is already rounded to the nearest number in that format, which results in a small rounding error
- This means that 0.1_{10} is converted to a binary number that's just very close to 0.1_{10}
- The error is tiny since 0.1_{10} is
 $0.100000000000000000000000055511151231257827$
- The constants 0.2_{10} and 0.3_{10} are also approximations to their true values
- So, $0.1_{10} + 0.2_{10} == 0.30000000000000000000000044408920985006_{10}$

Character Codes

程序代写代做 CS编程辅导

28

- So far, we have learnt how to represent numbers. How about text?
- To represent text characters, we use character codes
 - ▣ Essentially, we assign a unique code for each character we want to represent
- As computers have evolved, character codes have evolved. Larger computer memories and storage devices permit richer character codes
- Some of the character codes are
 1. BCD
 2. ASCII (American Standard Code for Information Interchange) (7 bits)
 3. Extended ASCII (8-bits)
 4. Unicode
 5. and others
- A binary number of n bits gives 2^n different codes
 - ▣ For $n=2$ there are $2^2=4$ different codes, i.e., bit combinations {00, 01, 10, 11}

WeChat: tutorcs

Assignment Project Exam Help

Binary Coded Decimal (BCD) code

程序代写代做 CS编程辅导

29

- when numbers, letters, or other symbols are represented by a specific group of symbols, it is said that the number, letter or word is being encoded. The group of symbols is called a code

□ Binary Coded Decimal (BCD) code

WeChat: cstutorcs

Assignment Project Exam Help

Email: tutorcs@163.com

QQ: 749389476

<https://tutorcs.com>

- In this code each decimal digit is represented by a 4-bit binary number

- BCD is a way to express each of the decimal digits with a binary code

- In the BCD, with four bits we can represent sixteen numbers (0000 to 1111)

$$256_{10} = 0010\ 0101\ 0110_{\text{BCD}}$$

And vise versa

$$0011\ 1000\ 1001_{\text{BCD}} = 389_{10}$$

ASCII Code

程序代写代做 CS编程辅导

30

- The most widely accepted one is called the American Standard Code for Information Interchange (ASCII).
- The ASCII code associates an integer value for each symbol in the character set, such as letters, digits, punctuation marks, special characters, and control characters.
- The ASCII table has 128 characters, with values from 0 through 127. Thus, 7 bits are sufficient to represent a character in ASCII.

Extended ASCII Characters

程序代写代做 CS编程辅导

32

- ASCII was designed in the 1960s for teleprinters and telegraphy, and some computing
- The number of printable characters was deliberately kept small, to keep teleprinters and line printers inexpensive
- When computers and peripherals standardized on eight-bit bytes, it became obvious that computers and software could handle text that uses 256-character sets at almost no additional cost in programming, and no additional cost for storage
- An eight-bit character set (using one byte per character) encodes 256 characters, so it can include ASCII plus 128 more characters
- The extra characters represent characters from foreign languages and special symbols for drawing pictures

A set of codes that extends the basic ASCII set. The extended ASCII character set uses 8 bits, which gives it an additional 128 characters

UNICODE

程序代写代做 CS编程辅导

34

- Many of today's systems use Unicode that can encode the characters of every language in the world
- The Java programming language, and some operating systems now use Unicode as their default character code
 - UTF-8 (8-bits: essentially the extended ASCII Table)
 - UTF-16 (16 bits: Most spoken languages in the world, widely used)
 - UTF-32 (32 bits: includes past languages, space inefficient)
