SOME EXAMPLES

程序代写代做 CS编程辅导

- Fencepost errors (off-by-one errors)
 - Example: how many numbers do you need to process between the range M and N , when $M=5$ and $N=17$?

- Example: OpenSSH channel allocation could result in a user gaining full privileges

WeChat: cstutorcs

```
if (id < 0 || id > channels_alloc) (1)
if (id < 0 || id >= channels_alloc) (2)
```

Software Vulnerability

程序代写代做 CS编程辅导

1. Buffer overflows

- software attempts data past end of size given

2. Bad input sanitation

- software doesn't check if input valid

3. Race condition

- software executes something "quickly" to change execution order

WeChat: cstutorcs

4. Access control

- who is allowed to access/alter what

Email: tutorcs@163.com

QQ: 749389476

5. Weak authentication/authorization/cryptography

<https://tutorcs.com>

6. Control flow

- altering data/pointers to change flow of the software

Software Vulnerability - categories

程序代写代做 CS编程辅导

1. Memory corruption

- accessing memory

developers didn't intend

2. Injection

- addition of unexpected data, pointers etc

3. Broken authentication

- bad control access, authentication, encryption, etc.

Attack surface describes where the vulnerabilities that can be exploited are...

QQ: 749389476

Normally means the external factors outsiders have access too (public websites, place to input information). If surface bypassed, then attacker can exploit internal vulnerabilities as well

Memory Corruption Vulnerabilities

程序代写代做 CS编程辅导

Memory corruption involves tricking a program to run arbitrary code that has been smuggled into memory

Affects stacks & heaps primarily, in some cases can effect other parts of memory

Buffer Overflow: A Well-Known Problem

程序代写代做 CS编程辅导

- A very common attack mechanism
 - 1988 Morris Worm, Red, Slammer, Sasser & many others

- Prevention techniques are known

Buffer Overflow Basics

程序代写代做 CS编程辅导

- Caused by programming error
- Allows more data to be stored than capacity available in a fixed sized buffer
 - buffer can be on stack, heap, global data
- Overwriting adjacent memory locations
 - corruption of program data
 - unexpected transfer of control
 - memory access violation
 - execution of code chosen by attacker

Reminder

程序代写代做 CS编程辅导

1. **Stack:** function parameters,

return addresses & local variables of function stored here

2. **Heap:** All dynamically allocated memory here

3. **%eip** Instruction pointer register stores next instruction address

4. **%esp** Stack pointer register stores stack top address

5. **%ebp** Base pointer register keeps track of function variables

Buffer Overflows

程序代写代做 CS编程辅导

- A buffer overflow/buffer overrun
 - anomaly where a program while writing data to a buffer, overruns buffer's capacity & overwrites adjacent memory locations
- Buffers are created to hold a defined amount of data
 - overflow occurs when a program attempts to write more data to a fixed length block of memory (buffer) than it is allocated to hold
- We could overwrite data
 - but data in stack is not always strings & integers
- One popular attack is to rewrite function return addresses to change control flow

2	
1	
<return address>	
<%ebp of main()>	<-- %ebp
<space for 'c'>	
<space for 'd'>	<-- %esp

Example

- There is no possible control path to secretFunction()
- If we can rewrite the return address of echo() to secretFunction instead of main(), can alter flow
- User has control of input
- No buffer length checks

Should be on lab VM

Buffer Overflow Attacks

程序代写代做 CS编程辅导

To exploit a buffer overflow an attacker:

- Must identify a buffer overflow vulnerability
 - inspection, tracing execution, fuzzing tools

- Understand how buffer is stored in memory & determine potential for corruption

Email: tutorcs@163.com

QQ: 749389476

<https://tutorcs.com>

- Discovering vulnerabilities can be relatively easy
- Exploiting them to a desired effect requires experimentation
 - Experimenting with BASH & Perl at command line can be useful to generate overflow buffers on the fly

```
$ perl -e 'print "A" x 20;'
```

 -e: executes command
 print: prints character A 20 times

```
-e 'print "\x41" x 20;'

print: prints character A (ascii 0x41) 20x

```
$ perl -e 'print "A"x20 . "BCD" . "\x61\x66 \x67 \x69" x2 . "Z";'

Heap overflow

程序代写代做 CS编程辅导

- Each process has a heap & stack for execution
 - Volatile, dynamically allocated memory for program needs
 - Grows towards high memory addresses

- Heap overflow/heap overrun is a type of buffer overflow
- Exploitation performed by corrupting data in ways to cause the application to overwrite internal structures, such as linked list pointers

WeChat: estutorcs

Assignment Project Exam Help

Email: tutorcs@163.com

- Heaps are complicated, changing in size, things get added, deleted & shifted
- We won't go into it, but since heaps are complex, with lots of pointers, there are lots of vulnerabilities

<https://tutorcs.com>

Language vulnerabilities

程序代写代做 CS编程辅导

- Modern high-level languages have strong notion of type & valid operations

- not vulnerable to buffer overflows
- incurs overhead & some limits on use

WeChat: cstutorcs

- C & related languages have high-level control structures

Assignment Project Exam Help

- **but** allow direct access to memory

Email: tutorcs@163.com

- hence vulnerable to buffer overflow

QQ: 749389476

- a large legacy of widely used, unsafe & hence vulnerable code

<https://tutorcs.com>

Insecure C functions

程序代写代做 CS编程辅导

- Most vulnerabilities in C are related to buffer overflows & string manipulation
- In most cases, this would result in a segmentation fault, but specially crafted malicious input values, adapted to the architecture & environment could yield to arbitrary code execution

WeChat: cstutorcs

Assignment Project Exam Help

strcpy does not check buffer lengths & may overwrite memory zone contiguous to the intended destination

strcpy, strcat & strcmp

<https://tutorcs.com>

Secure C functions - mitigation

程序代写代做 CS编程辅导

- Use **strncpy**, if available (only the case on BSD systems)

- However, it is very to define yourself...

- OR **strcpy_s()** - similar to **strcpy()**, when there are no constraint violations

- function copies characters from source string to a destination character array up to & including terminating null character

WeChat: cstutors

Assignment Project Exam Help

- **gets()** does not check for buffer length

Email: tutorcs@163.com

- use fgets (& dynamically allocated memory)

- **String formatting attacks:** printf, fprintf, sprintf & snprintf

- next weeks lecture

Non Executable Address Space

程序代写代做 CS编程辅导

- Many Buffer Overflow attacks by machine code into buffer & transfer control to this
- Use virtual memory support to make some regions of memory non-executable (to avoid execution of attacker's code)
 - e.g. stack, heap, global data
 - need h/w support in MMU - long existed on SPARC/Solaris systems
 - more recently on x86 Linux/Unix/Windows systems
- Mapping from virtual to physical addresses handled by MMU chip in conjunction with OS
 - Provides translation of addresses for programs & a large memory space, but also provides protection & reduces memory fragmentation

Memory corruption prevention

程序代写代做 CS编程辅导

Secure software practices to prevent this include:

1. Check size of object you are writing to & size of what you are writing
2. If you are taking information from one data type to another, check sizes
3. This is more difficult at the Assembly level (pro's/con's working close to hardware)

Preventing Memory Corruptions

程序代写代做 CS编程辅导

1. Develop code to check before anything is written
2. Lock data
 - Effective at one level but makes life harder in most cases
3. Make the "gap filler" less predictable? (Canaries)

WeChat: cstutorcs

These cover several stages in the software lifecycle

Compile-Time Defences: Programming Language

程序代写代做 CS编程辅导

- Use a modern high-level languages with strong typing
 - not vulnerable to buffer overflow
 - compiler enforces range checks & permissible operations on variables
- Does have cost in resource use
- And restrictions on access to hardware
 - so still need some code in C-like languages

Compile-Time Defences: Safe Coding Techniques

程序代写代做 CS编程辅导

- If using potentially unsafe languages e.g. C
- Programmer must explicitly write safe code
 - by design with new code
 - ***extensive after code review*** of existing code, (e.g., OpenBSD)

WeChat: cstutorcs

Assignment Project Exam Help

- Allow for graceful failure (know how things may go wrong)
 - check for sufficient space in any buffer

Compile-Time Defences: Language Extension, Safe Libraries

程序代写代做 CS编程辅导

- Proposals for safety extensions (library replacements) to C
 - performance penalties
 - must compile programs with special compiler

WeChat: cstutorcs

- Several safer standard library variants
 - new functions, e.g. `strcpy()`
 - safer re-implementation of standard functions as a dynamic library, e.g. Libsafe
